The overall theme I want to explore for the final project is how to present digital information in a physical way. For example, how to present certain notifications that carrying specific information. Connected device.

I've been thinking few ideas and might need to be improved. Definitely need your suggestions.

1). A notification device that can filter your messages(or emails) based on the importance level (or categories).
There might be three balls representing three different focus levels. For each focus level, they'll filter different messages. Such as the most focus level ball would only allow messages from certain people. When the message arrives, the ball would be levitated by air flow. There might be light too (or sound). Might be a way to play the message too. (on the device or on the laptop)

2). A notification device that shapes as a cactus. Each needle is a bill message. Whenever a bill message comes, A needle would point out. Want to reveal the pain of paying the bill.

3). There is a situation that when people constantly checking the email box because they're waiting for an email from certain people. Maybe there can be a small device that notifies you about that specific messages. It might look like a mail slot on the door and you can attach on your laptop. Or something else.

4). Many people spend lots of time lying on the bed every morning to check their phones. Most of time they just want to check time or weather or some minor information but then they are attracted to other apps and lost in the information sea. Maybe there can be a device that you can set up what kind of information you want to hear every morning and put in the sequence. So every morning you can activate the device and get all the information in voice.
